

Economics of Poor Grazing Management

Training Objective: Viewers learn about the many factors that can turn poor into excellent grazing management and the economic losses of poor management even when poor grazing is profitable.

Training Description: Viewers of this webinar gain an understanding of the importance of the forage-animal balance equation in deciding if overstocking and overgrazing are taking place on a beef cow/calf operation. An actual case study is the basis for illustrating average annual costs and average annual benefits due to excellent grazing practices. One surprise was the farmer's response to the resulting, very high quality pasture.
